

# **Genaro Network**

## **DApp Develop Guide**

V1.0

# 1. How to join Genaro testnet

## Install docker:

Centos: yum install docker

Ubuntu: apt-get install docker

## Pull testnet node docker image:

docker pull genaronetwork/go-genaro-test

## Start a Genaro node for testnet:

docker run -d --name "testnode" -p 30303:30303 -p 8545:8545 genaronetwork/go-genaro-test

## See logs:

docker logs -f testnode

## Wait for synchronization:

```

```

## Client attach node:

docker run -it --rm genaronetwork/go-genaro-test go-genaro attach [http://\[ip\]:8545](http://[ip]:8545)

```
Welcome to the go-genaro JavaScript console!

instance: go-genaro/v1.0.0-testing-f402efa7/linux-amd64/gol.10.4
modules: admin:1.0 eth:1.0 net:1.0 personal:1.0 rpc:1.0 web3:1.0
```

# 2. Write smart contract

## Download genaro-solidity compiler:

wget https://github.com/GenaroNetwork/genaro-solidity/releases/download/1.0.0/solc-linux.zip

unzip solc-linux.zip

chmod 0775 solc

## create a contract:

touch test.sol

```
cat test.sol:
```

```
pragma solidity ^0.4.13;  
contract MyContract {  
    mapping(address => uint) public scores;  
  
    function SetScore(uint score) public {  
        scores[msg.sender] = score;  
    }  
}
```

Building source code:

```
./solc test.sol --bin --abi --optimize -o test-output/
```

```
>ls test-output/
```

```
MyContract.abi  MyContract.bin
```

```
>cat test-output/MyContract.abi
```

```
[[{"constant":true,"inputs":[{"name":"","type":"address"}],"name":"scores","outputs":[{"name":"","  
"type":"uint256"}],"payable":false,"stateMutability":"view","type":"function"},{"constant":false,"i  
nputs":[{"name":"score","type":"uint256"}],"name":"SetScore","outputs":[],"payable":false,"stat  
eMutability":"nonpayable","type":"function"}]]
```

```
>cat test-output/MyContract.bin
```

```
608060405234801561001057600080fd5b5060f18061001f6000396000f30060806040526004  
361060485763ffffffff7c0100000000000000000000000000000000000000000000000000000000  
0060003504166376dd110f8114604d57806396e9c85314608a575b600080fd5b34801560585  
7600080fd5b50607873ffffffffffffffffffffffffffffffff6004351660a1565b60408051918252519  
081900360200190f35b348015609557600080fd5b50609f60043560b3565b005b6000602081  
9052908152604090205481565b336000908152602081905260409020555600a165627a7a723  
0582063796536ca4052d134adb0f2ae3f5a27e8073fb09cece937cba5ba91944c3d4e0029
```

### If your solc can not run,you can pull Genaro solc image:

```
docker pull genaronetwork/genaro-solc
```

```
docker run --rm -v `pwd`:/root:z genaronetwork/genaro-solc solc /root/test.sol --bin --abi  
--optimize -o /root
```

**You can get more help from the website**(<https://solidity.readthedocs.io/en/v0.4.24/>).

### 3. Deploy contract

#### Attach node:

docker run -it --rm genaronetwork/go-genaro-test go-genaro attach [http://\[ip\]:8545](http://[ip]:8545)

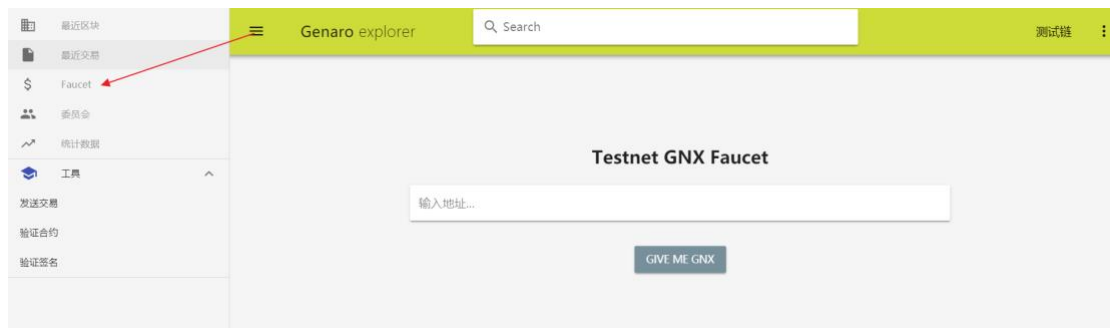

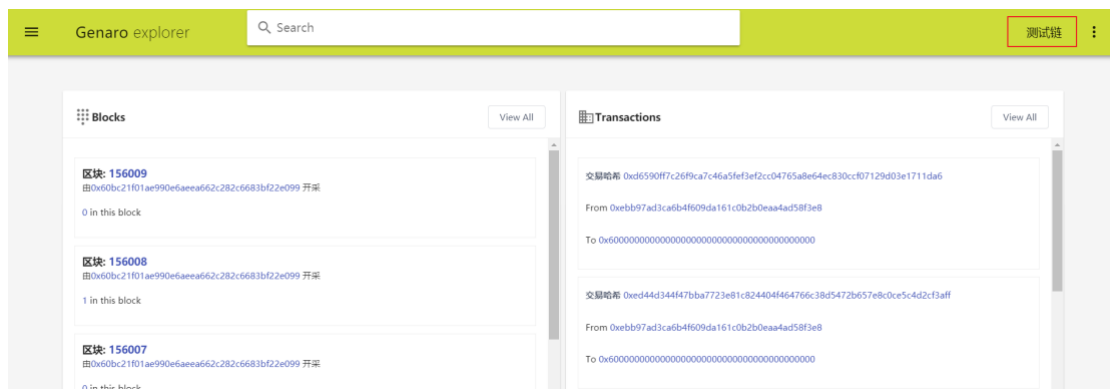

#### create a account:

> personal.newAccount("your password")

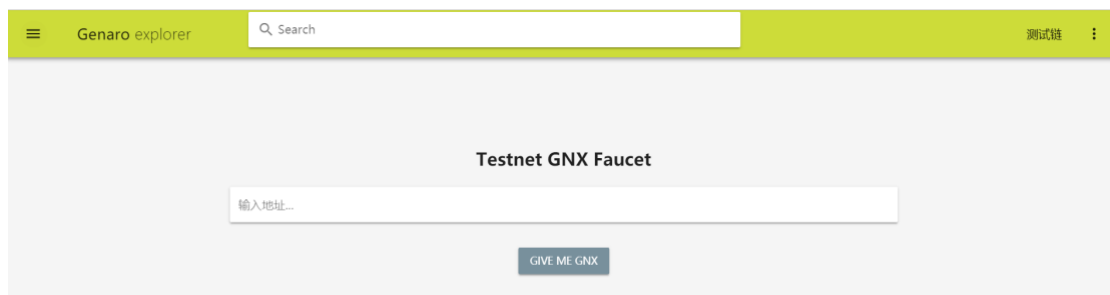

0x..... (this is your account address)

#### Get some balance for your account:

Go to: <http://explorer.genaro.network/>

#### Input your address:

#### Check your balance:

>eth.getBalance("your account")

5000000000000000000

Deploy contract with your account:

```
> code =
"0x608060405234801561001057600080fd5b5060f18061001f6000396000f300608060405260
04361060485763ffffffff7c01000000000000000000000000000000000000000000000000
000060003504166376dd110f8114604d57806396e9c85314608a575b600080fd5b348015605
857600080fd5b50607873ffffffffffffffffffffffffffffffff6004351660a1565b604080519182525
19081900360200190f35b348015609557600080fd5b50609f60043560b3565b005b60006020
819052908152604090205481565b336000908152602081905260409020555600a165627a7a7
230582063796536ca4052d134adb0f2ae3f5a27e8073fb09cece937cba5ba91944c3d4e0029"
> abi =
[{"constant":true,"inputs":[{"name":"","type":"address"}],"name":"scores","outputs":[{"name":"","
"type":"uint256"}],"payable":false,"stateMutability":"view","type":"function"},{"constant":false,"i
nputs":[{"name":"score","type":"uint256"}],"name":"SetScore","outputs":[],"payable":false,"stat
eMutability":"nonpayable","type":"function"}]

> myContract = eth.contract(abi)
...
> personal.unlockAccount("your account address")
...(input your password)
> contract = myContract.new({from:"your account address",data:code,gas:1000000})
...
{
  abi: [{
    constant: false,
    inputs: [...]},
    name: "SetScore",
    outputs: [],
    payable: false,
    stateMutability: "nonpayable",
    type: "function"
  ]},
  address: undefined,
  transactionHash: "your contract transaction address"
}
```

**Get your contract address:**

```
>eth.getTransactionReceipt("your contract transaction address")
...
contractAddress: "your contract address",
...
```

## 4. Use contract

### Attach node:

```
docker run -it --rm genaronetwork/go-genaro-test go-genaro attach http://\[ip\]:8545
```

```
> abi =
```

```
[[{"constant":true,"inputs":[{"name":"","type":"address"}],"name":"scores","outputs":[{"name":"","type":"uint256"}],"payable":false,"stateMutability":"view","type":"function"},{"constant":false,"inputs":[{"name":"score","type":"uint256"}],"name":"SetScore","outputs":[],"payable":false,"stateMutability":"nonpayable","type":"function"}]
```

```
...
```

```
> myContract=eth.contract(abi)
```

```
...
```

```
> contract=myContract.at("your contract address")
```

```
...
```

### Get your score:

```
> contract.scores("your account address")
```

```
...
```

### Set your score:

```
> personal.unlockAccount("your account address")
```

```
...(input your password)
```

```
> contract.SetScore.sendTransaction(10,{from: "your account address",gas:1000000})
```

```
"your transaction address"
```

```
>eth.getTransactionReceipt("your transaction address")
```

```
...
```

```
status: "0x1", (0x0 is fail, 0x01 is success)
```

```
...
```

```
> contract.scores(eth.accounts[0])
```

```
10
```

**The contract worked correctly.**

## 5. Develop android DApp client

### Start your own server node:

```
docker run -d --name "server" -p 30310:30303 -p 8560:8545 --env SERVER="true"  
genaronetwork/go-genaro-test
```

### download web3j:

```
wget https://github.com/web3j/web3j/releases/download/v3.4.0/web3j-3.4.0.zip
```

### generate java file for contract:

```
./web3j solidity generate /opt/contract/MyContract.bin /opt/contract/MyContract.abi -o  
/opt/contract/ -p com.genaro  
Generate file: com/genaro/MyContract.java
```

### Java code:

```
String rpcAddr = "your rpc address";  
String contractAddress = "your contract address";  
  
Web3j web3 = Web3j.build(new HttpService(rpcAddr));  
  
try {  
    Credentials ownerAddrCredentials =  
WalletUtils.loadCredentials("your password", "your account key file");  
    MyContract contract = MyContract.load(contractAddress, web3,  
ownerAddrCredentials, web3.ethGasPrice().send().getGasPrice(),  
BigInteger.valueOf(1000000));  
    TransactionReceipt rec =  
contract.setScore(BigInteger.valueOf(20)).send();  
    if (rec.isStatusOK()) {  
        System.out.println(contract.scores("your account  
address").send().intValue());  
    }  
} catch (IOException e) {  
    e.printStackTrace();  
} catch (CipherException e) {  
    e.printStackTrace();  
} catch (Exception e) {  
    e.printStackTrace();  
}
```

## 6. use Genaro Network storage

Java lib: <https://github.com/GenaroNetwork/libgenaro-java>

### Java code example:

Initialize:

```
String V3JSON = "{ \"address\":  
\"aaad65391d2d2eafda9b27326d1e81d52a6a3dc8\",  
  \"crypto\": { \"cipher\": \"aes-128-ctr\",  
                Genaro Network
```

```

        \ "ciphertext\ ":
    \ "e968751f3d60827b6e62e3ff6c024ecc82f33a6c55428be33249c83edba444ca\ ",
        \ "cipherparams\ ": { \ "iv\ ": \ "e80d9ec9ba6241a143c756ec78066ad9\ " },
    \ "kdf\ ": \ "scrypt\ ",
        \ "kdfparams\ ": { \ "dklen\ ": 32, \ "n\ ": 262144, \ "p\ ": 1, \ "r\ ": 8,
    \ "salt\ ":

    \ "ea7cb2b004db67d3103b3790caced7a96b636762f280b243e794fb5bef8ef74b\ " },
        \ "mac\ ":
    \ "ceb3789e77be8f2a7ab4d205bf1b54e048ad3f5b080b96e07759de7442e050d2\ " },
        \ "id\ ": \ "e28f31b4-1f43-428b-9b12-ab586638d4b1\ ", \ "version\ ": 3 }";
String passwd = "xxxxxx";
Genaro api = new Genaro("http://192.168.50.206:8080");
GenaroWallet gw = new GenaroWallet(V3JSON, passwd);
api.logIn(gw);

```

Upload file:

```

String bucketId = "5bfcf4ea7991d267f4eb53b4";
String filePath = "xxxxxxxxxx";
String fileName = "xxx";
new Uploader(api, false, filePath, fileName, bucketId, new Progress() {
    @Override
    public void onBegin() {
    }
    @Override
    public void onEnd(int status) {
    }
    @Override
    public void onProgress(float progress, String message) {
    }
}).start();

```

Download file:

```

String V3JSON = "{ \ "address\ ":
    \ "aaad65391d2d2eafda9b27326d1e81d52a6a3dc8\ ",
        \ "crypto\ ": { \ "cipher\ ": \ "aes-128-ctr\ ",
        \ "ciphertext\ ":
    \ "e968751f3d60827b6e62e3ff6c024ecc82f33a6c55428be33249c83edba444ca\ ",
        \ "cipherparams\ ": { \ "iv\ ": \ "e80d9ec9ba6241a143c756ec78066ad9\ " },
